Cloning of human full-length Ches in an Crosson, man	Vector JOURNAL Unpublished REFERRNCE 2 (bases 1 to 528)	AUTHOKS, Kalnine, N., Chen, X., Rolfs, A., Halleck, A., Hines, L., Eisenstein, S., Koundinya, M., Raphael, J., Moreira, D., Kelley, T., LaBaer, J., Lin, Y., Phelan, M. and Farmer, A.	JAT.	CUMMENT This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without encourage.	tag). The CDS has been directionally cloned using BD In-Fusion (TM) cloning system between the Sall and HindIII sites of the pDNR-DUAL vector. Additional sequences in the Clone: "ACC" after SALI site and before 'ARG' to provide Kozak consensus sequence: 'GG' after	last codon and before HindIII site to maintain reading frame. This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Bach CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and Hindill sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after Clone distribution: http://bioinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /translation="MOIAIHHPWIRRPFPFHSPSRLPDQFFGHLLESDLFPTSTSL

The invention relates to a truncated alpha-crystallin polypeptide derived from a wild-type alpha-crystallin protein, where the truncated polypeptide lacks an N-terminal sequence present in the wild-type protein. The composition and methods are useful for enhancing protein (e.g. insulin or alcohol dehydrogenase) expression or secretion and for preventing protein agraegation. These may also be used for creating a thermophilic host that tolerates elevated temperatures. The present sequence represents human N-terminal truncated alpha-crystallin DNA. New truncated alpha-crystallin polypeptide derived from a wild-type alpha -crystallin protein, useful for enhancing protein (e.g. insulin or alcohol dehydrogenase) expression or secretion and for preventing protein /partial /product= "N-terminal truncated alpha-crystallin" /note= "No start codon given" alpha-crystallin; enhanced protein expression; enhanced protein secretion; protein aggregation; heat tolerance; elevated temperature; human; ds; gene. The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      222

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularisation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularization or diseases associated with chronic inflammation, myocardial ischemia, stroke, coronary artery disease or peripheral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SerArgGluPheHisArgArgTyrArgLeuProSerAsnValAspGlnSerAlaLeuSer 80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularisation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.

The invention relates to a chimera alpha BNAC polynucleotide that encodes a chimeric alpha BNAC polypeptide. The polypeptide is useful for preventing protein aggregation. The polypeptide is also useful for increasing the shelf life of proteins of pharmaceutical value. The polypeptide shows an increase in accessible hydrophobic regions, forms larger size oligomers, shows an increase in intersubunit interaction, forms larger aggregates, forms larger proous oligomers and shows an increased ellipticity as compared to eye lens crystallins alpha A and alpha B. The tryptophan residues in the polypeptide are less solvent accessible as compared to those of eye lens crystallins alpha A and alpha B. The polypeptide shows extraordinarily high chaperone-like activity ranging between 3 - 6 times that of the eye lens crystallins alpha A and alpha B. The present sequence represents the chimera DNA that encodes
New chimera alpha BNAC nucleic acid, useful for preventing aggregation of proteins and also for increasing shelf life of proteins of pharmaceutical value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              184 GACACTGGACTCTCAGAGATGCGCCTGGAGAAGGACAGGTTCTCTGTCAACCTGGATGTG 243

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 1; SEQ ID NO 26581; 80pp; English.

alternative splicing events, in detecting and characterising gross alterations in the ganomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPFO at

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide concoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that expressed in human cells or tissues. Also included are a spatially-compression (comprising a plurality of single exon nucleic acid molecule addressable set of single exon nucleic acid probes for measuring human comprising a plurality of probes is separately exon microarray for measuring human gene expression, a method of contiguous amino acids of any of the above-mentioned amino acid so from a contiguous amino acids of any of the above-mentioned amino acid so contiguous amino acids of any of the above-mentioned amino acid so sequences (optionally with conservative amino acid substitutions), and extra expression acids of any of the above-mentioned amino acid so selling and/or licensing single exon probes or microarrays to methods of selling and/or licensing single exon probes or microarrays to human gene expression and a computer-readable contage medium which contains a database having a plurality of record to the probes methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying cited above. The probes methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying to specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising and contains and addition, and characterising and contains and addition, and characterising and contains and electric and contains and identifying and characterising and contains and determine and contains and determine and contains and determine and contains and identifying and characterising and contains and electric and contains and electric and contains and electric and c segdata.uspto.gov/sequence.html?DocID=20030194704

Claim 15; SEQ ID NO 12881; 80pp; English.

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues. DK; Hanzel WPI; 2004-119264/12. Rank DR, enn SG,

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide controlled in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences fully defined in the specification. The probe is a single exon probe that controlleds are a spatial sequences of thybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially.

Capters expression (comprising a plurality of single exon nucleic acid addressable set of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single conting human gene expression, a method of contiguous amino acids of any of the above mentioned amino acid probe cited above, an ORF-encoded peptide comprising at least 8

Contiguous amino acids of any of the above mentioned amino acid solated antibody that binds specifically to a peptide cited above, a cited above in a period of solated antibody that binds specifically to a peptide cited above.

Capter of solated antibody that binds specifically to a peptide cited above.

Capter of solated antibody and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing

thuman gene expression data by subscription, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   203 CAGGACGACCACGGCTACATTTCCCGTGAGTTCCACCGCCGCCTACCGCCTGCCGTCCAAC 262

The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  468
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlyMetLeuThrPheCysGlyProLysIleGlnThrGlyLeuAspAlaThrHisAlaGlu 106

The method comprises a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the renal toxicity of a compound, predicting the renal toxicity of a compound, or identifying toxicity markers in tissues or cells exposed to known renal toxin. The genes are useful as toxicity markers in drug screening and toxicity assays, in monitoring disease or physiological states, or disease progression. This polymucleotide

e toxic or cells ng toxic effects of compounds or the progression of these toxic by determining the changes in gene expression in tissues or cells to the toxin and comparing these to gene expression in unexposed tissues or cells. Predicting teffects by (effects be

Claim 1; SEQ ID NO 1419; 239pp; English

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or toxin and compound or progression of a toxic effect, preferably the.

Compound or progression of a toxic effect, preferably the, compound or progression of a toxic effect, preferably the, compound or progression of a toxic effect, preferably the, compound or progression of a toxic effect or progression of expression in a tissue or cell sample exposed to the compound of two or corresponse and predict creation, where differential expression of the genes is indicative of at least two probes (on a solid creaponse and predict cellular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatocoxin of set of genes comprising at least two genes listed in the specification, and a user interface to view the information used to present information identifying the expression level in a tissue or cell of at least one gene companies in the specification and containing the expression level in a tissue or cell of at least one gene containing the expression level in a tissue or cell of at least one gene companies. cell toxicity markers in drug screening and toxicity assays. The genes and gene expression information may be used as diagnostic markers for the prediction or identification of the physiological state of tissue or cal sample that has been exposed to a compound or agent. Hepatotoxicity is characterised by centrilobular necrosis and steatosis. The present sequence is an expressed sequence tag (EST) or cDNA derived from a gene which is differentially expressed in response to a hepatotoxic agent changes in gene expression and for identifying toxicity markers in tissues or cell exposed to a known toxin. The genes may be used as

|||| |----GCTCTGGCCCTGAG 1050 The invention relates to a method of predicting (the progression of) a kidney tissue or call sample exposed to the compound and comparing the gene expression profile of a kidney tissue or call sample exposed to the compound and comparing the gene expression profile to a database, or detecting the level of gene (s) expression in a tissue or call sample exposed to the compound, where differential gene expression compared to a control indicates a toxic effect (toxicity progression). The method is useful for predicting (the progression of) at least one toxic effect of a compound. The genes are useful as toxicity markers in drug screening and toxicity assays. The methods are useful for predicting the likelihood that a compound or test agent will induce various specific kidney pathologies, such as nephritis, kidney necrosis, glomerular and tubular injury, or focal segmental glomerulosclerosis. The methods are useful for determining the similarity predicting or elucidating the potential cellular pathways influenced, induced or modulated by the compound or test agent. The kit is useful for predicting or modulated by the compound or test compound, for monitoring the progression of renal disease states, for identifying genes that show promise as new drug targets and for screening known and newly method drugs. This sequence corresponds to a gene marker used in the method of the invention. (Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic monitoring the progression of renal disease states, comprises preparing agene expression profile of a kidney tissue or cell sample exposed to the ---ThrSerAlaPro 121 of a toxic response to one or more individual compounds and for ds; toxic effect; gene expression profile; kidney tissue; differential gene expression; toxicity progression; toxicity drug screening; toxicity assay; kidney pathology; nephritis; .kidney necrosis; glomerular injury; tubular injury; focal segmental glomerulosclerosis. The present invention relates to a composition comprising an isolated amino acid sequence that comprises a portion of human mitochondrial called dehydrogenase protein (MDH), particularly the minimum activator of DNA fragmentation sequences. The composition is useful for treating cancer chosen from liver cancer, gastric cancer, head cancer, neck cancer, lung cancer, breast cancer, prostate cancer, cervical cancer, pancreatic cancer, colon cancer, prostate cancer, stomach cancer, mouth cancer, tongue cancer, sum cancer, stomach cancer, muscle cancer, mouth cancer, tongue cancer, carcingae cancer, muscle cancer, heart cancer, bronchial cancer, cancer, carcingae cancer, bladder cancer, bone marrow cancer, cancer, uterus cancer, thymus cancer, bone marrow cancer, lymphoma cancer, method cancer, thymus cancer, bladder cancer, thyroid cancer, brain cancer, neuron cancer, gall bladder cancer, thyroid cancer, brain cancer, neuron cancer, gall bladder cancer, cultar cancer, joint cancer, glioblastoma, mesothelioma, lymphoma, leukaemia, melanoma, squamous cell carcinoma, osteosarcoma, and Kaposi's sarcoma. The present sequence is a coding sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               243

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins and/or protein activities. Protein chaperones (also known as heat shock proteins) are divided into 4 families on the basis of their primary sequence and chaperone properties: HSP90, HSP70, HSP60 and SHSP (small heat shock protein). The invention is based upon the finding that among the SHSP family, which have a general structure of a cental domain (called the alpha-crystallin domain) flanked by N and C-terminal regions, replacement of one or more regions of an SHSP with the corresponding region from a second SHSP can improve the activity compared to native SHSPs. In a particualr embodiment of the invention, the hybrid chaperone is a hybrid SHSP designated alphaB-HSP27 comprising the N-terminus and central portion of alphaB-crystallin and the C-terminal tail of HSP27. However, the hybrid protein chaperones of the invention can comprise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hybrid protein chaperone (e.g. heat shock protein) useful for stabilizing proteins and/or protein activities, or as an agent to prever protein aggregation, or for treating diseases involving altered protein conformations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             site generates

femily. The invention also encompasses methods for stabilising proteins such as enzymes, therapuetic proteins, diagnostic proteins, reporter proteins or antibodies, their fragments or conjugates in an aqueous colution using hybrid protein chaperones; stabilised protein formulation comprising at least one protein associated with the above hybrid protein chaperone; mucleic acids and vectors encoding a hybrid protein chaperone; and the coexpression of a recombinant protein of interest and a hybrid protein chaperone; and the coexpression of a recombinant protein of interest and a hybrid protein chaperone; and the coexpression of a recombinant protein of interest and a hybrid protein chaperone. The hybrid protein chaperones are useful as agents to prevent protein agregation, as inhibitors of cell death and genome stability pathways, for identification of proteins that are in the process of unfolding, for the treatment of diseases involving altered protein conformations (e.g., cardiomyopathies, cataracts or neurodegenerative disease), or for the manufacture of a medicament for the treatment of such diseases. The present sequence represents a mutant and alphabe-crysteallin DNA sequence in which the G at position 497 was mutated from I (see ADE75375) to generate a unique Aval restriction site which was used for subsequent casestte mutagenesis (along with a vector-labbacture);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     479
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hybrid protein chaperone, protein stabilisation; heat shock protein, sHSP family; protein aggregation inhibition; cell death inhibition; genome stability pathway inhibition; protein denaturation identification; protein conformation related disease; cardiomyopathy; cataract; neurodegenerative disease; cardiant; ophthalmological; neuroprotective; gene therapy; alphaB-crystallin; wild-type; human; cassette mutagenesis;

The invention relates to a hybrid protein chaperone for stabilising proteins and/or protein activities. Protein chaperones (also known as heat shock proteins) are divided into 4 families on the basis of their primary sequence and chaperone properties: HSP90, HSP70, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP family, which have a general structure of a central domain (called the alpha-crystallin domain) flanked by N and C-terminal regions. region from a second sHSP can improve the activity compared to native sHSPs. In a particualr embodiment of the invention, the hybrid chaperone is a hybrid sHSP designated alphaB-HSP27 comprising the N-terminus and central portion of alphaB-crystallin and the C-terminal tail of HSP27. However, the hybrid protein chaperones of the invention can comprise regions from HSP90, HSP70 and HSP60 families as well as from the sHSP callin also encompasses methods for stabilising proteins or antibodies, their fragments or conjugates in an aqueous soluth as enzymes, theorem compasses methods for stabilising proteins or antibodies, their fragments or conjugates in an aqueous solution using hybrid protein. diagnostic proteins or antibodies, their fragments or conjugates in an aqueous comprising at least one protein sascoiated with the above hybrid protein chaperone; nucleic acids and vectors encoding a hybrid protein chaperone. The hybrid protein chaperones in the coexpression of a recombinant potein of interest and a hybrid protein protein aggregation, as inhibitors of cell death and genome protein aggregation, as inhibitors of cell death and genome protein conformations (e.g., cardiomyopathies, cataracts or the treatment of such disease, cardiomyopathies, cataracts or the treatment of such disease, the prosence are removed and the recompassion of a medicament for the treatment of such disease, the present sequence of a medicament as all of the protein or the protein chaperone or the treatment of a tenest sequence of a medicament as 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New hybrid protein chaperone (e.g. heat shock protein) useful for stabilizing proteins and/or protein activities, or as an agent to prevent protein aggregation, or for treating diseases involving altered protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mutated to G (see ADE75374) to generate a unique Avaī restriction site which was used for subsequent cassette mutagenesis (along with a vector-based SacI site) to introduce heterologous C-terminal sequences onto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the treatment of such diseases. The present sequence represents a wild-type human alphaB-crystallin DNA sequence. The T at position 497 was mutated to G (see ADE7574) to generate a unique Aval restriction site which was used for subsequent account account of the security of the analyses.
                                                                                                                                                           /note= "Mutagenesis of T to G at this site generates a unique Aval site between bases 493-498"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 537 BP; 118 A; 171 C; 124 G; 124 T; 0 U; 0 Other;

binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LysHisPheSerProGluAspLeuThrValLysValGluAspAspPheValGluIleHis 47

Horrigan S; Endress G,

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.

The present invention describes a method (MI) for screening for an antic neoplastic agent. The method involves exposing cells to a chemical agent
c be tested for anti-neoplastic activity, determining a change in
c expression of at least one gene (I) a signature gene set, where (I)
c comprises a sequence (S) selected from 8447 sequences (given in Abb61664
cc ABL70110), or is at least 95% identical to (S), where a change in
expression is indicative of anti-neoplastic activity. (I) has cytostatic
activity and can be used in gene therapy. MI can be used for screening an
enti-neoplastic agent, and can be used for producing a product which is
the data collected with respect to the anti-neoplastic agent as a result
of MI, and the data is sufficient to convey the chemical structure and/or
properties of the agent. MI can be used in the treatment of cancer such
as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney,
prostate or pancreatic cancer, adenocarcinoma, clear cell
cancer, infiltrating ductal cancer, infiltrating lobular cancer, sequences
concer, infiltrating and will will be appillary carcinoma and Wilm's
concernation.

```
Diagnosing breast cancer in a patient comprises detecting the level or gene expression in cell or tissue samples, where a differential gene expression is indicative of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                           Human, breast specific gene, breast cancer, differential expression, cytostatic, gene therapy, gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                    Human breast cancer associated coding sequence SEQ ID NO: 1100.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-meoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M., and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.

```
patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at
The present invention relates to methods of diagnosing breast cancer in a

The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or progression of benign prostatic hyperplasia (BPH), or screening (II) for the method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate coldecting as compared to normal prostate tissue. (I) comprises from the subject that are differentially regulated compared to normal prostate cells. (I) comprises preparing a first gene expression profile of BPH cells or BPH-like cell population, exposing the cells to the agent, preparing a second gene expression profile of BPH cells or agent, preparing the first and second gene expression profiles. (I) for underlying the first and second gene expression profiles. (I) for useful for diagnosing the onset or progression of BPH. (II) is useful. The methods are useful to present information identifying the expression cold genes or cells, by comparing the expression level of genes confident in the specification in the tissue or cells to the level of expression level in the database, and displaying the expression level of expression level in the database, and displaying the expression level comparing the comparing between the expression level of expression level in the tissue or cell sample compared to the humannlasian and expression human benign prostatic humanniasian and expression human benign prostatic

RESULT 22
                                  The invention relates to a novel purified complex comprising a first polypeptide and a second polypeptide, where the polypeptides comprise defined amino acid sequences listed in the specification, and where the first polypeptide binds to the second polypeptide. A complex of the invention has virucide and cyrostatic activity, and may have a use as vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09584-ADF09697 represent cDNA's of the
                                                                                                                                                                                                            New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing a condition involving altered level of the complex e.g. human papilloma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 87
                                                                                                                                                                                                                                                                    The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

The methods are useful for classifying a breast cancer patient, to partient similarity value. The methods are useful for classifying a breast are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.

An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from CDNAs and genomic DNAs. 5' ESTs are also used to obtain full length gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included.

ESTs are derived from mRNAs with intact 5' ends and can therefore be us to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

The present sequence is one of a large number of 5' ESTS derived from meRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.

They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 526

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTRR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNAs sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        588

                                                                                                                                                                                                                                                                                                                                                                     The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GGAAAACATGAAGAGCGCCAGGATGAACATGGTTTCATCTCCAGGGAGTTCCACAGGAAA 662

The present sequence is one of a large number of 5' ESTS derived from mRNAs, encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. Esquences usually correspond mainly to the 3' untranablated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length CDNAs and genomic DNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer and for treating illnesses associated with described in the method of the invention

appearing as ABX34836-ABX49947, or complements of them. Also included are it (1) a transformed call having a nucleic acid comprising an LWPD nucleic acid linked to a promoter and a 3' non- translated sequence that that churctions in the call to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid, where the detection of the complementary nucleic acid, where the detection of the complementary nucleic acid, where the detection of the molecule. The LMPD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle correction of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the laborine lMPD SST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       299

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              448
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            113
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          556

ABX39112
```

The invention relates to a purified nucleic acid molecule associated with actation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleicide sequences.

(7 (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that acid linked to a promoter and a 3' non- transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (1) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any complementary nucleic acid molecule obtained from the bovine cell or complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the detection of the complementary nucleic acid molecule obtained from the molecule; and (b) complementary nucleic acid molecule. The LMFD nucleic acid, where complementary nucleic acid molecule. The MFD nucleic acid, sused for detecting the level or pattern of the molecule. The LMFD nucleic acid is predictive of the detection of the complementary nucleic acid is predictive of the cell or pattern of the molecule. The LMFD nucleic acid is used for the determining a level or pattern of a molecule in a bovine cell or tissue. The present sequence mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the complement sequence was not shown in the specification but was obtained in present in the passent sequence in the passent sequence of the electronic format from the hyperonic parterned in the passent sequence in the passent seque

Sequence 449 BP; 91 A; 148 C; 100 G; 110 T; 0 U; 0 Other;

thenotypic probe) R3, Perturbagen F802, Perturbagen F820, their

biologically active modifications, or biologically active fragments. Also
included are the polymucleotides encoding the perturbagens, a vector

comprising the polymucleotide, preparing an RA pathway related

polypeptide, acceening (M) putative RA-related therapeutics, by exposing

a polypeptide, careening (M) putative RA-related therapeutics, by exposing

ca polypeptide/target interaction pair identified by a method utilising

the RA pathway polypeptide, to a number of agents, and recovering a

subpopulation of disrupting agents which competitively displace the

polypeptide from the target, where the disrupting agents are putative RA-

related therapeutics. Also include are an isolated RA pathway polypeptide

comprising PATI (a kinesin light chain-related protein) polypeptide and

its encoding polymucleotide, a gene therapy vector comprising the RA

comprising the gene therapy vector. The RA pathway polypeptide is useful

comprising the gene therapy vector. The RA pathway polypeptide is useful

comprising the gene therapy vector. The RA pathway polypeptide is

comprising the gene therapy vector. The RA pathway related

comprising the gene therapy vector and a host cell

comprising the gene therapy vector. The RA pathway related

comprising the gene therapy vector mile a host cell

comprising the gene therapy vector mile a most cell

comprising the gene therapy vector mile a pack of the interacts with RA pathway-related

comprising the gene therape that interacts mile and identifying a polypeptide (respect interaction pair, by

detecting reporter expression, where the reporter expression is

comprised the formation of the interaction pair, (M) is a serial transfer the reporter expression is a less useful the formation of the interaction and parameters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ಡ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      yeast two-hybrid assay. The polypeptide is also useful for treating an RA
pathway-related condition e.g. lung cancer, Karposi's sarcoma, breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        psoriasis, acute promyelocytic leukaemia (APL). The present sequence is CDNA fragment encoding a partial target molecule isolated by the yeast two hybrid system, alpha crystallin B chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer, pancreatic cancer, neuroblastoma, renal cancer, ovarian cancer, dermatitis, hyperkeratosis, eczema, Darier's disease, Reiter's disease,

The invention relates to a novel anticancer activity-increasing agent for enhancing a therapeutic effect on head and neck cancer by inhibiting a gene those expression is increased in head and neck cancer cells. The agent of the invention demonstrates cytostatic activities and may be useful for enhancing a therapeutic effect on head and neck cancer by inhibiting a gene those expression is increased in head and neck cancer cells, as well as for effectively treating cisplatin-resistant head and neck cancer, possibly via antisense therapy. The current sequence is that of the human Hsp27 (heat shock protein 27) cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                361 ACCGGCAAGCACGAGGAGCAGGACGAGGATGGCTACATCTCCCGGTGCTTCACGCGG 420

The present invention describes a composition which comprises a therapeutic agent that reduces the amount of active heat shock protein 27 (hsp27) in hsp27 expressing cells exposed to the therapeutic agent. The composition has cytostatic activity, and can be used in gene therapy. The composition is useful in treating cancer, e.g., prostate, bladder, lung, breast, pancreatic, colon, skin (for example melanoma), renal or ovarian cancer or a central nervous system malignancy. The present sequence represents a color section of human hsp27, which is used in the

The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological conference. The invention also relates to a method of diagnosing or response. The invention also relates to a method of diagnosing or comprising obtaining nucleic acids from a sample, contacting the invention of a more or more or more or more or more or more or more hybridisation complexes and comparing the plurality of cDNAs under hybridisation complexes and comparing the levels of the detected hybridisation complexes with the level of hybridisation complexes (condition) and of against the complexes of the detected hybridisation complexes with the level of hybridisation complexes correlates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a method for identifying a plurality of polynucleotide probes. The compression of target polynucleotides. The microarray for monitoring the diagnosis of an immunopathology, such as Crohn's disease, asthma, conference of the expression of target polynucleotides. The microarray can be used in clearity in the treatment of the disease, asthma, conference of the diseases. The microarray may also be used in drug discovery and development, toxicological and also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of a subpopulation of may also be used in purification of

The invention relates to 242 human STATG-activating proteins and CDNAs encoding them (ADG10411-ADG10894) and to sequences with 95% or more homology to the STATG-activating proteins and their encoding nucleic comprising a STATG-activating protein encoding nucleic acids. The invention also relates to recombinant vectors and host cells comprising a STATG-activating protein encoding nucleic acid; the recombinant production of a STATG-activating protein; an antibody especific for a STATG-activating protein; an antibody ribozymes targeted to nucleic acids encoding a STATG-activating protein; methods of screening for activators or inhibitors of STATG-activating protein; methods of screening for activators or inhibitors of STATG-activating protein; administration of the drug compositions. The STATG-activating proteins, nucleic acids encoding them, and medulators of their activity or expression; and methods of treating patients by nucleic acids encoding them, and modulators of their activity or expression are useful in the diagnosis and treatment of allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, cancer infections (e.g., HIV), cancer and disorders associated with Thl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              407

RESULT 40 ABQ60780 g Š 셤 ð d ઠ 셤 ð g The present invention describes an isolated tumour-associated antigenic caracte (TAT) nucleic acid comprising: (a) any of 4622 nucleotide sequences (see SEQ ID NO:1 to 4622); (b) the full-ingth coding region of sequences (see SEQ ID NO:1 to 4622); (b) the full-ingth coding region of sequences (see SEQ ID NO:1 to 4622); (c) a sequence that has 80% of sequence acid (a); (c) the complement of (a) or (b); a sequence that hybridises to (a)-c) or (c). Also described: (1) an expression vector comprising the above expression vector; (3) a process for producing a polypeptide; (4) an isolated polypeptide comprising; (a) an amino acid sequence encoded by any of the above comprising the above polypeptide; (b) an amino acid sequence encoded by the full-composition of an isolated antibody; (b) an anion acid sequence so (c) a sequence of an isolated antibody; (b) an isolated oligopeptide; (c) a comprising the above polypeptide; (d) an isolated oligopeptide; (d) a composition of matter comprising the above polypeptide; (d) a union-associated antigenic target (TAT) composition of matter comprising the above (chimeric) polypeptide; (d) an antibody, oligopeptide or TAT binding organic molecule, in combination where the growth of a cell that expresses the above protein; (l2) method of inhibiting the growth of a cell that expresses the above protein; (l3) a method of the cells that express the above protein; (l3) a method of a tumour in a containing the express the above protein; (l4) a method of a tumour in a mammal, (l6) a method of interased expresses the above protein; (l3) and encounced a tumour in a sample subsected of containing the presence of a protein in a sample subsected of containing the protein; (l5) a method of diagnosing the presence of a treated with increased expression or activity of the above containing an early of protein; and (l7) a method of diagnosing the prope preventing or treating cancer. The composition is also used for preparing a medicament for the therapeutic treatment or diagnostic detection of a cell proliferative disorder or cancer. The present sequence represents a New nucleic acid molecule and encoded polypeptide, for diagnosing, preventing or treating cell proliferative disorders such as cancer. therapy. The composition and methods are useful for diagnosing, Claim 1; SEQ ID NO 3041; 5504pp; English. 15-OCT-2003; 2003WO-US029126. 18-OCT-2002; 2002US-0418988P. GENENTECH INC WPI; 2004-534300/51. current tissues. ABB/8931 to ABB/8004 represent proteins expressed in cancer tissues. ABB/8931 to ABB/8004 represent proteins encoded by the ABG/6776 to ABG/6078 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence of a polymucleotide encoded by a concoded by (I) is useful for determining the presence of a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists

according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 467

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are volverexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; fusion for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids and diagnosis of cancer in mammals. TAT polypeptides and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides and mammals. TAT polypeptides and methods and compositions for the treatment or diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antibodies, antagonists in professions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          527
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     528 AAATACACGCCCCCCCCGGTGTGGACCCCACCCAAGTTTCCTCCTCCTGTGTCGCCTGAG 587

The invention relates to a novel isolated nucleic acid and the PRO CC polypeptide encoded by it. A protein of the invention has antiinflammatory, antiatherit, antirheumatic, immunosuppressive, consteopathic, antidabetic, dermatological, antipsoriatic, antiallergic, antiasthmatic, hepatotropic, and respiratory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the control of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, configuration arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, sjoren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune crowing configuration disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, duillain-Barre syndrome, disease, infectious or autoimmune chronic active hepatitis, primary cliflammatory bowel disease, gluten-sensitis, soleroaing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, an autoimmune or immune-mediated skin disease, asthma, allergic rhinitis, atopic dermatitis, food disease, asthma, allergic rhinitis, atopic dermatitis, food disease, asthma, allergic rhinitis, atopic dermatitis, food disease, erginopathic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or commune encodes a proper protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 865 BP; 178 A; 312 C; 235 G; 140 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting
                                                                                  407

-----CATGCCCAA 1003
the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcoinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug texicacy and drug metabolism. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Diagnosing liver cancer cells, useful for treating liver cancer associated with chronic hepatitis or cirrhosis comprises detecting the level of expression in a tissue sample of one or more genes associated with cancerous liver tissues.

Claim 1; SEQ ID NO 2; 176pp; English.

The present invention describes a method for diagnosing liver cancer cells comprising detecting the level of expression in a tissue sample of one or more genes given in the specification (see ADD70997 to ADD71105), where differential expression of the genes is indicative of liver cancer. Also described: (1) detecting the progression of liver cancer in a patient, (2) monitoring the treatment of a patient with liver cancer; (3) treating a patient with liver cancer; (4) typing a liver cancer in a patient with chronic hepatitis or cirrhosis; (6) differentiating liver patient with chronic hepatitis or cirrhosis; (6) differentiating liver cancer related to chronic hepatitis from liver cancer related to cancer related to chronic hepatitis from liver cancer related to cirrhosis; (7) screening for an agent capable of modulating the onset or progression of liver cancer; (8) a composition comprising at least two oligonucleotides comprising a sequence that specifically hybridises to oligonucleotides; (10) a computer system comprising a database containing information identifying the level in liver tissue of a set of genes; (11) a method for using the computer system to present information identifying or the expression level in tissue or call of any of the genes; (12) a therapeutic agent for slowing or halting the progression of liver cancer. The methods are useful for treating liver cancer associated with chronic claimed human gene sequence which is used in the exemplification of the present invention.

Example 11; Page 300-302; 336pp; English.

The invention relates to systems, methods and reagents for cell-based conscreening or detection of compounds which affect particular biological functions. The methods of the invention utiliae fluorescent biodetector alteration in the cellular distribution of at least the fluorescent biodetector alteration in the cellular distribution of at least the fluorescent conscience and theorescent proteins of a cerivation translocate to the nucleus. In the cytoplasm, but on stress activation translocate to the nucleus. In another embodiment biodetector proteins can be used to detect protease of the cytoplasm, but on stress activation translocate to the nucleus. In another embodiment biodetector fusion proteins comprise one or more cituity. Such protease biodetector fusion proteins comprise one or more artivity. Such protease biodetector fusion proteins comprise one or more cituity such proteins a recognition signal which is cleaved by the protease, or may be from hererologous sources. Due to the components may be components of a single protein which is acted upon by the protease, or may be from hererologous sources. Due to the components may be components of a single protein which is acted upon by components may be components of a single protein which is acted upon by the protease of interest, the cloarisation signal, the biodetector protein is localised to a particular component protein is cleaved from the localisation sequence, and is free to migrate to other locations within the cell. The presence of a second localisation signal attached to the fluorescent protein enables compartment after cleavage of the protease recognition sequence. The fluorescent protein control cleavage of the protease recognition and to screen compounds which modulate these companies with a high degree of spatial resolution. The methods such the screening of cellular activities and to screen compounds which modulate these compounds which may be used for the screening of protein enables of example, may be used for the screening or protein enable

The invention describes methods of automated detection, classification comprising treating cells containing luminescent and identification comprising treating cells containing luminescent, where contained the craporter molecules (I) in array of locations with a test substance, where (I) are detectors, classifiers or identifiers, imaging cells in each contain luminescent signals and converting optical information into digital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins in the test substance. The method are useful for detection of toxins chosen from proteases, ADP-riborylating toxins, cytotoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as detectors, classifiers and identifiers are described and serve as reporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without sacrificing the ability to detect many new mutant toxins or dissect several complex mixtures of known toxins. This sequence encodes a such as biosensor associated with the protease biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1003 CTCAGCAGCGGGGTTCTCGGAGATCCGGCACACTGCGGACCGCTGGCGCGTGTCCCTGGAT 1062

Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cellexposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Elashoff MR; Castle AL, Johnson KR, Porter MW, WPI; 2002-241625/29. Mendrick D,

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the compounds or the progression of these toxic effects by determining the compound or brogression in tissues or cells exposed to the toxic effect coff a compound or progression of a toxic effect, preferably the hepatotoxicity of a compound, comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or the genes listed in the specification, where differential expression of method can also be used to identify an agent which modulates the toxic cell. The methods utilise a set of at least two probes (on a solid cell). The methods utilise a set of at least two probes (on a solid specifically hybridises to a gene listed in the specification, a computer system comprising a database containing information identifying the specification at its such a test two genes listed in the specification, a computer system comprising at least two genes listed in the specification, a computer comprising at least two genes listed in the specification. The method user interface to view the information used to present information can user interface to view the information used to be used as changes in gene expression level in a tissue or cell of at least one gene changes in gene expression and for identifying toxicity markers in control of the physiological state of tissue or cell exposed to a known toxin. The genes may be used as contains and contains and continuously markers for the contains and contai Claim 1; SEQ ID NO 981; 239pp; English.

Sequence 604 BP; 124 A; 156 C; 199 G; 125 T; 0 U; 0 Other;

Predicting (the progression of) a toxic effect of a compound, for monitoring the progression of renal disease states, comprises preparing gene expression profile of a kidney tissue or cell sample exposed to the

Claim 11; SEQ ID NO 848; 266pp; English.

The invention relates to a method of predicting (the progression of) a coxic effect of a compound by preparing a gene expression profile of a database, or detecting the level of gene (so kidney tissue or cell sample exposed to the compound, where gene expression in a tissue or cell sample exposed to the compound, where (differential gene expression). The method is useful for predicting (the captession of) at least one toxic effect of a compound. The genes are useful as toxicity markers in drug screening and toxicity assays. The cuseful as toxicity markers in drug screening and toxicity assays. The methods are useful for predicting the likelihood that a compound or test of methods are useful for predicting the likelihood that a compound or test cagent will induce various specific kidney pathologies, such as nephritis, kidney necrosis, glomerular and tubular injury, or focal segmental confounds and toxic response to one or more individual compounds and for predicting or elucidating the potential cellular pathways influenced, induced or modelling the potential cellular pathways influenced, induced or modelling the toxic response of a test compound, for monitoring the progression of renal disease states, for identifying genes that show promise as new drug targets and for screening known and newly designed drugs. This sequence corresponds to a gene marker used in the compound or the show promise as new drug targets and for screening known and newly designed drugs. This sequence corresponds to a gene marker used in the compount or the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic second specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 604 BP; 124 A; 156 C; 199 G; 125 T; 0 U; 0 Other;

Human pancreatic cancer expressed cDNA SEQ ID NO 43

(first entry)

14-JAN-2003

ABV94670;

46

```
The invention relates to an isolated polymucleotide (I) comprising: (a) any of a group of over 4000 mucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP66596-ABP66637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypetide are useful in treating pancreatic cancer and stimulating an immune response. The polymucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        314 Greaaccaerresececesascasersacesteaasaccaassaresestassaste 373
